

Configure the network shown in the figure. Make the basic configuration on each router and configure EIGRP as the routing protocol. Configure the access-list to do the following:

1. Stop all traffic going to the email server 192.168.1.200, except the email traffic (POP3 and SMTP).
2. Stop all traffic going to the web server 192.168.5.10, except the web traffic (HTTP).
3. Stop the ICMP traffic from network 192.168.6.0 to the network 192.68.3.0.
4. Allow the telnet to all the routers from the admin computer 192.168.4.10 and stop any other address from doing Telnet to the routers.
